
Fuel system replacement for school district (Alhambra, California)

Alhambra School District selected Lindmark Engineering as the general contractor to remove and replace underground storage tanks, piping, and fuel dispensing and management systems for a school bus service yard. Because the tanks were located in the main driveway to the bus service area, the challenge was to avoid interrupting school services. Realizing that access and timing were critical, we made several changes to the layout to improve traffic flow at the service islands, as well as moving tank locations to better fit existing conditions.

We completed the job on time and on budget, despite an unexpected period of inclement weather during the major tank removal and installation process. Bus access to the service areas was maintained at all times. *Client: Alhambra School District*
