
Site remediation services (Long Beach, California)

After thoroughly evaluating a large number of qualified candidates, the Port of Long Beach selected Lindmark Engineering as one of its consultants for an ongoing site remediation contract. Selection criteria included

- technical capabilities;
- understanding of the Port's mission to resolve issues that impact the environment, as well as Port operations and development; and
- similar previous or existing contracts for public agencies.

This open contract, which extended from December 2000 through November 2003, included such services as short-notice, fast-track remediation and removal of hazardous waste and involved extensive coordination with various Port divisions, tenants, and contractors. We provided a variety of services under this contract, including assisting the Port with the handling and removal of hazardous waste and materials from the former Queen Mary Energy Plant. We also profiled soils and transported and disposed more than 8,000 tons of petroleum hydrocarbon-impacted soil from various Port redevelopment areas. *Client: Port of Long Beach*
